<p>A purifying method of a soln., contg. charged organic material and inorganic salt, comprises electrodialysis by using cation-exchange membrane, having anion-exchange gp. on the surface, which contacts a soln. contg. charged organic material, and if pH of the soln. is in range, the organic material is positively charged and electrodialysis by using anion-exchange membrane, having cation-exchange gp. on the surface, which surface contacts with a soln., contg. charged organic material, in case that pH of the soln. is in the range, in which the organic material is negatively charged.          USE/ADVANTAGE - Useful for desalting of the soln. mixt., comprising inorganic salt and organic material, e.g. amino acid, nucleic acid peptide or protein. (Typ Dwg.No.0/0)</p>
